

Watering by Immersion

If you use pure bark substrates or substrates without water-attracting or water-storing aggregates, this is the only possible irrigation method..

How it works

It is best to take the coaster off and immerse the entire Orchitop, e.g. in a bucket (in which you have filled water or a fertilizer solution) under water so that the water level is a maximum of 1 cm below the upper edge of the rods. Then let the Orchitop stand in the water for 10-15 minutes so that the substrate and the roots can soak up moisture and then take the Orchitop out of the water bath. You let it drain, attach the coaster and put the plant back in its original location. For phytosanitary reasons, fresh water / fertilizer solution must be used for each plant.
